

Error code 30174-4 when installing Office

Office 2016, Office for business, Office 365 Admin, Office 365 Small Business, More...

You might see this error if your anti-virus software, firewall, proxy settings, or connection prevent you from installing Office. Here are some things you can try to fix the problem. We've listed the most common solutions first, so try them in order, starting with installing Office with the offline installer.

1 - Install Office using the offline installer

The Office offline installer may help bypass potential proxy, firewall, antivirus, or Internet connection issues that might occur during an Office 2016 installation.

For steps to install an offline version of Office 2016, see [Use the Office 2016 offline installer](#) and select the correct tab for your version of Office.

2 - Use a wired connection

If you aren't already using a wired connection to the Internet, plug your device in and try installing Office again.

3 - Try installing from another location

If you're trying to install at work or at school, the network may be limited in a way that won't allow Office to install. If this is the case, take your device home, to a friend's house, or to a wireless hotspot, and then try installing Office again.

Note: If you need to install Office from work or school, your IT department might be able to help you deal with any network limitations.

4 - Temporarily turn off proxy settings

If you use your device both at home and at work, try turning off the proxy settings in Microsoft Edge or Internet Explorer before you install Office. If you're using a different browser, check their help to find out how to turn off proxy settings.

Microsoft Edge

1. Click the **Start** button  (lower-left corner), and choose **Settings**.
2. Select **Network & Internet**, go to the bottom of the selections on the left side, and click **Proxy**.
3. In **Automatic proxy setup**, automatically detect settings or use setup script, by sliding to **On** or **Off**.
4. In **Manual proxy setup**, you can choose to use a proxy server. Generally, it will be off and if you slide it to **On**, be sure to select **Save**. And if it was off by default before you turned it on, be sure to slide back to **Off** when you've finished using it.

Internet Explorer 7, 8, 9, 10, or 11

1. In Internet Explorer, click **Tools** (upper-right corner) > **Internet options**.
2. Click the **Connections** tab, and then click the **LAN settings** button.
3. Under Proxy server, clear the option "Use a proxy server for your LAN (These settings will not apply to dial-up or VPN connections)."
4. Click **Apply** and **OK** to save changes. Restart your computer.

Note: There might be more proxy settings that you need to bypass. If this doesn't work, and you're installing Office from work or school, check with your IT department for more information. For IT administrators, please see [Office 365 URLs and IP address ranges](#).

5 - Temporarily turn off antivirus

For information about how to turn off your antivirus software, check your antivirus manufacturer's website. Uninstalling your antivirus software may also help. Don't forget to reinstall it after Office is finished installing and if you turned it off, be sure to turn it on again.

If you're not sure which antivirus software you have, use the following instructions to get to Control Panel to find the name of your antivirus software.

Tip: Windows 10 comes with default antivirus software, Windows Defender. If you determine that you're using it, select the **Start** button > **Settings** > **Update & Security**, and then select Windows Defender on the left. Slide the button to **Off**. Remember to turn it **On** again.
